

Abstract of the Disclosure

A man's brief includes a conventional main body with front openings flaps for conventional access when wearing the brief; and an inside support pocket. The pocket is established with a lower conformable, upwardly curved pouch connected to the inside front of the main body and a pair of flaps extending upwardly from opposite sides of the pouch. An elastic back edge is provided on the edge of the pouch to establish a lower elastic opening to the pouch from the back side. The flaps extending upwardly from the opposite ends of the elastic pouch perimeter to establish the upper perimeter of the opening with the flaps in their closed position, and are movable between a closed position overlapping one another and laying flat against the front panels of the main body generally above the pouch, and an open position separated laterally from one another to open the pouch from above. A two-part snap closure, with complimentary snap parts connected to each of the flaps, enable opening and closing the flaps, and thereby opening and closing the pouch for entry from above.
